

CO551 Open Source Systems Assignment 2

Submission 2015 2016

Tutor

Indrachapa Bandara

Student Name

Robert Collcott

ID

21302939

Session Time and Day 9:30 AM to 12PM

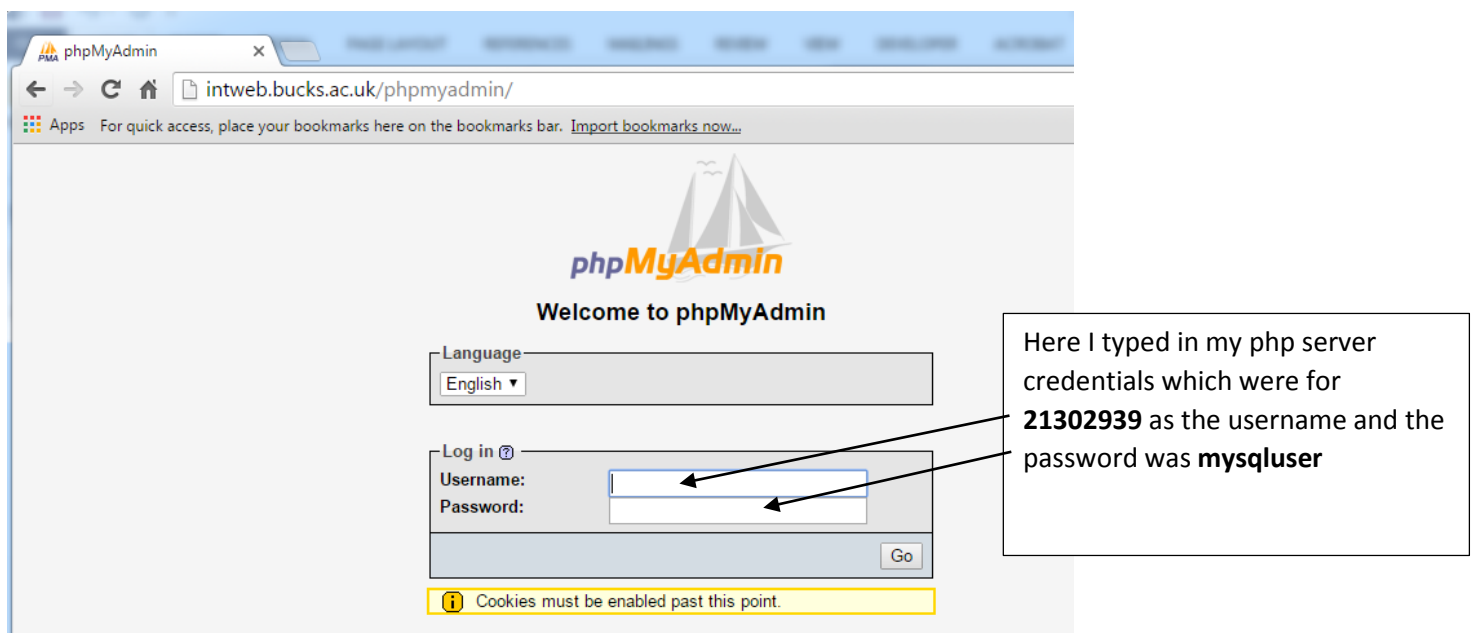

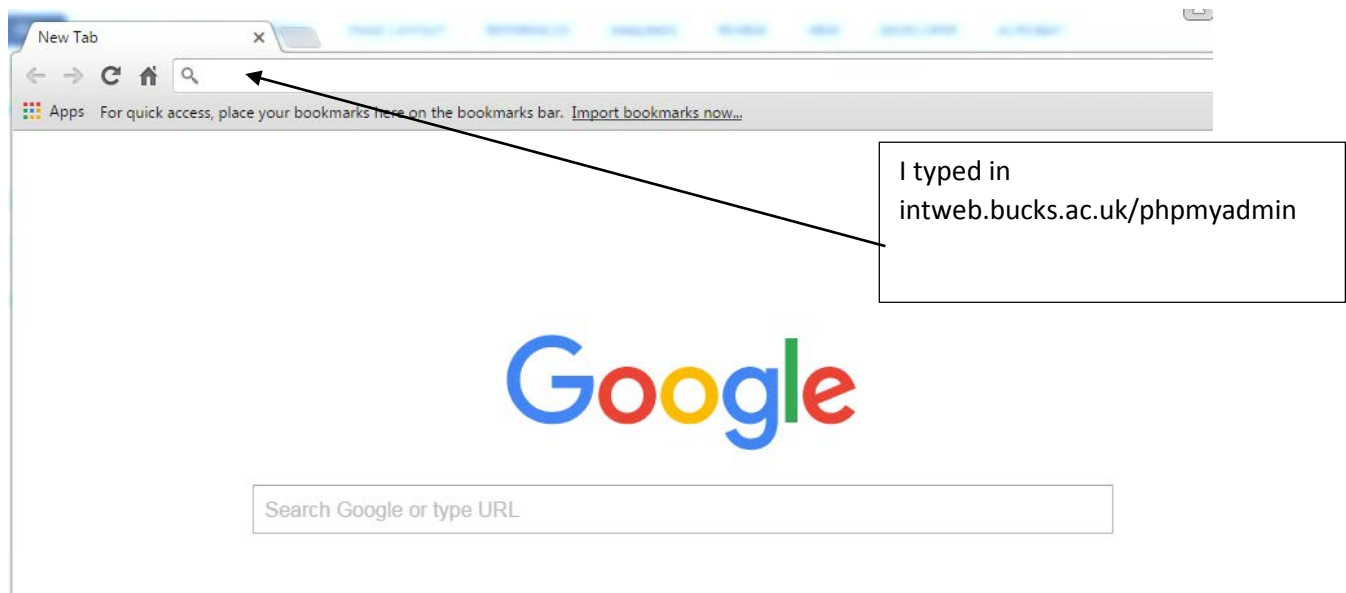

Tuesdays

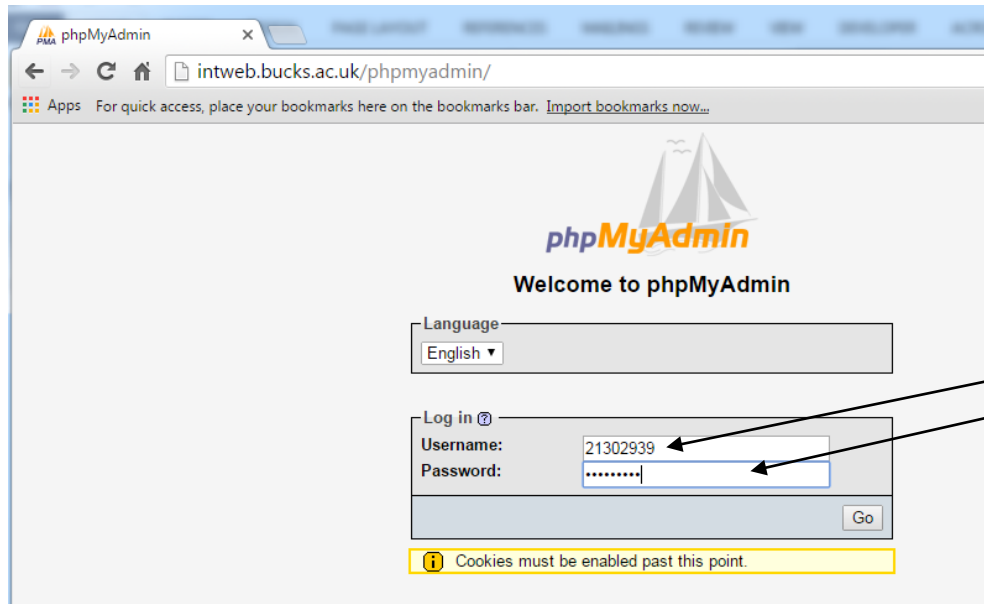

CO551 Open Source Systems CW2 Contents

Task 1 -- Through the MySQL command line add a new module to the module table.....	3
Task 2 -- UML Diagram for the UN alternated college application.....	7
Colours Key reference for College Application 2016 UML Diagram – Task 2	8
Task 3 -- Create a new script that will display all the student records within the student table. The data within each field should be displayed inside the cells of an html table.....	9
Task 4 -- Add a new column to the displayed student table that contains checkboxes that allow selecting each of the table rows for performing certain operations. Add a Delete Button in the bottom of the list that allows deleting the selected student records from the database.....	10
Adding new students to the college application system.....	10
Deleting Student records from the database	12
Assigning a module to the student modules table.....	13
Task 5 as the application stands there is no facility to add new students to the student table. Create a new html file that contains a form for entering student details. The details should be submitted to a php script that builds an SQL statement, that when executes inserts the student details into the student table	14
Evidence of showing new students added to the student table	19
Task 6 -- Improving the UI/UX of the college application.....	20
Home Page background before and after	20
Implementing a checkbox and delete button to tell system user is new student and potential deletion of student records easier.....	22
Hyperlinks to Official Text CSS Web Buttons	24
Task 7 Evaluation of PHP and ASP.net.....	28
Task 7 Evaluation of PHP and ASP.net continued	29
CO551 Open Source Systems Assignment 2 References	31

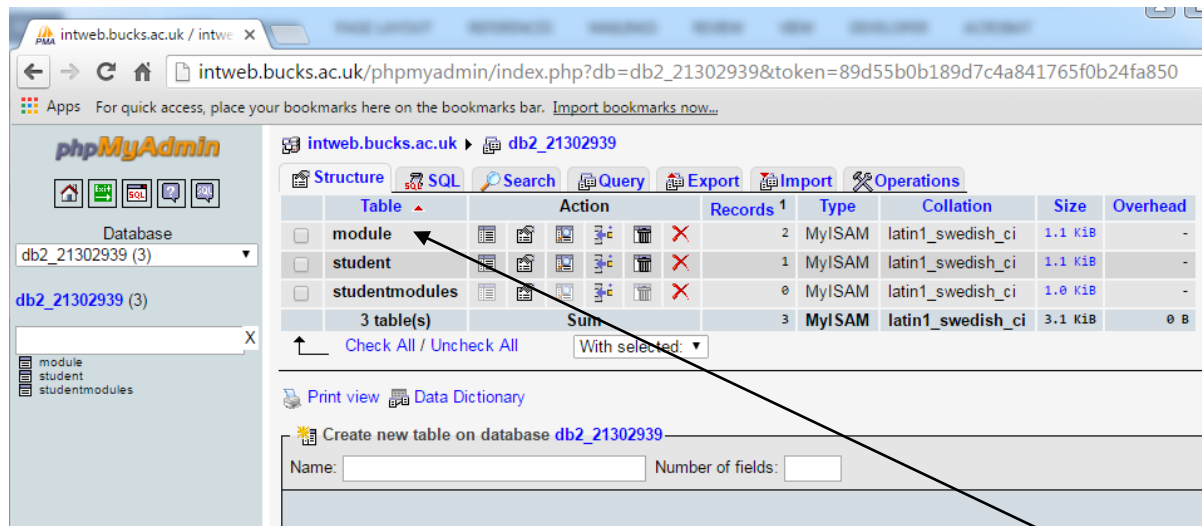

Task 1 -- Through the MySQL command line add a new module to the module table.

Due to time constraints and knowledge of the PUTTY program I decided to use the windows web server tool on the Bucks New University int web server tool named php my admin this is a tool where you can add databases and tables within them

Here I typed in my php server credentials which were for **21302939** as the username and the password was **mysqluser**

From when I logged in I setup a new database named db2_21302939 and created 3 tables

Named the following

- Module
- Student
- Student modules

Here I typed in my php server credentials which were for **21302939** as the username and the password was **mysqluser**

intweb.bucks.ac.uk / intwe x Introduction - Big Deal on x 17-final.pdf

intweb.bucks.ac.uk/phpmyadmin/index.php?db=db2_21302939&token=89d55b0b189d7c4a841765f0b24fa850

module
student
studentmodules

intweb.bucks.ac.uk db2_21302939 module

Browse Structure SQL Search Insert Export Import Operations Empty Drop

1 row(s) inserted.

```
INSERT INTO 'db2_21302939'.'module' (
  'code',
  'type',
  'level'
)
VALUES (
  'CO654', 'Practical', '6'
);
```

Run SQL query/queries on database db2_21302939: @

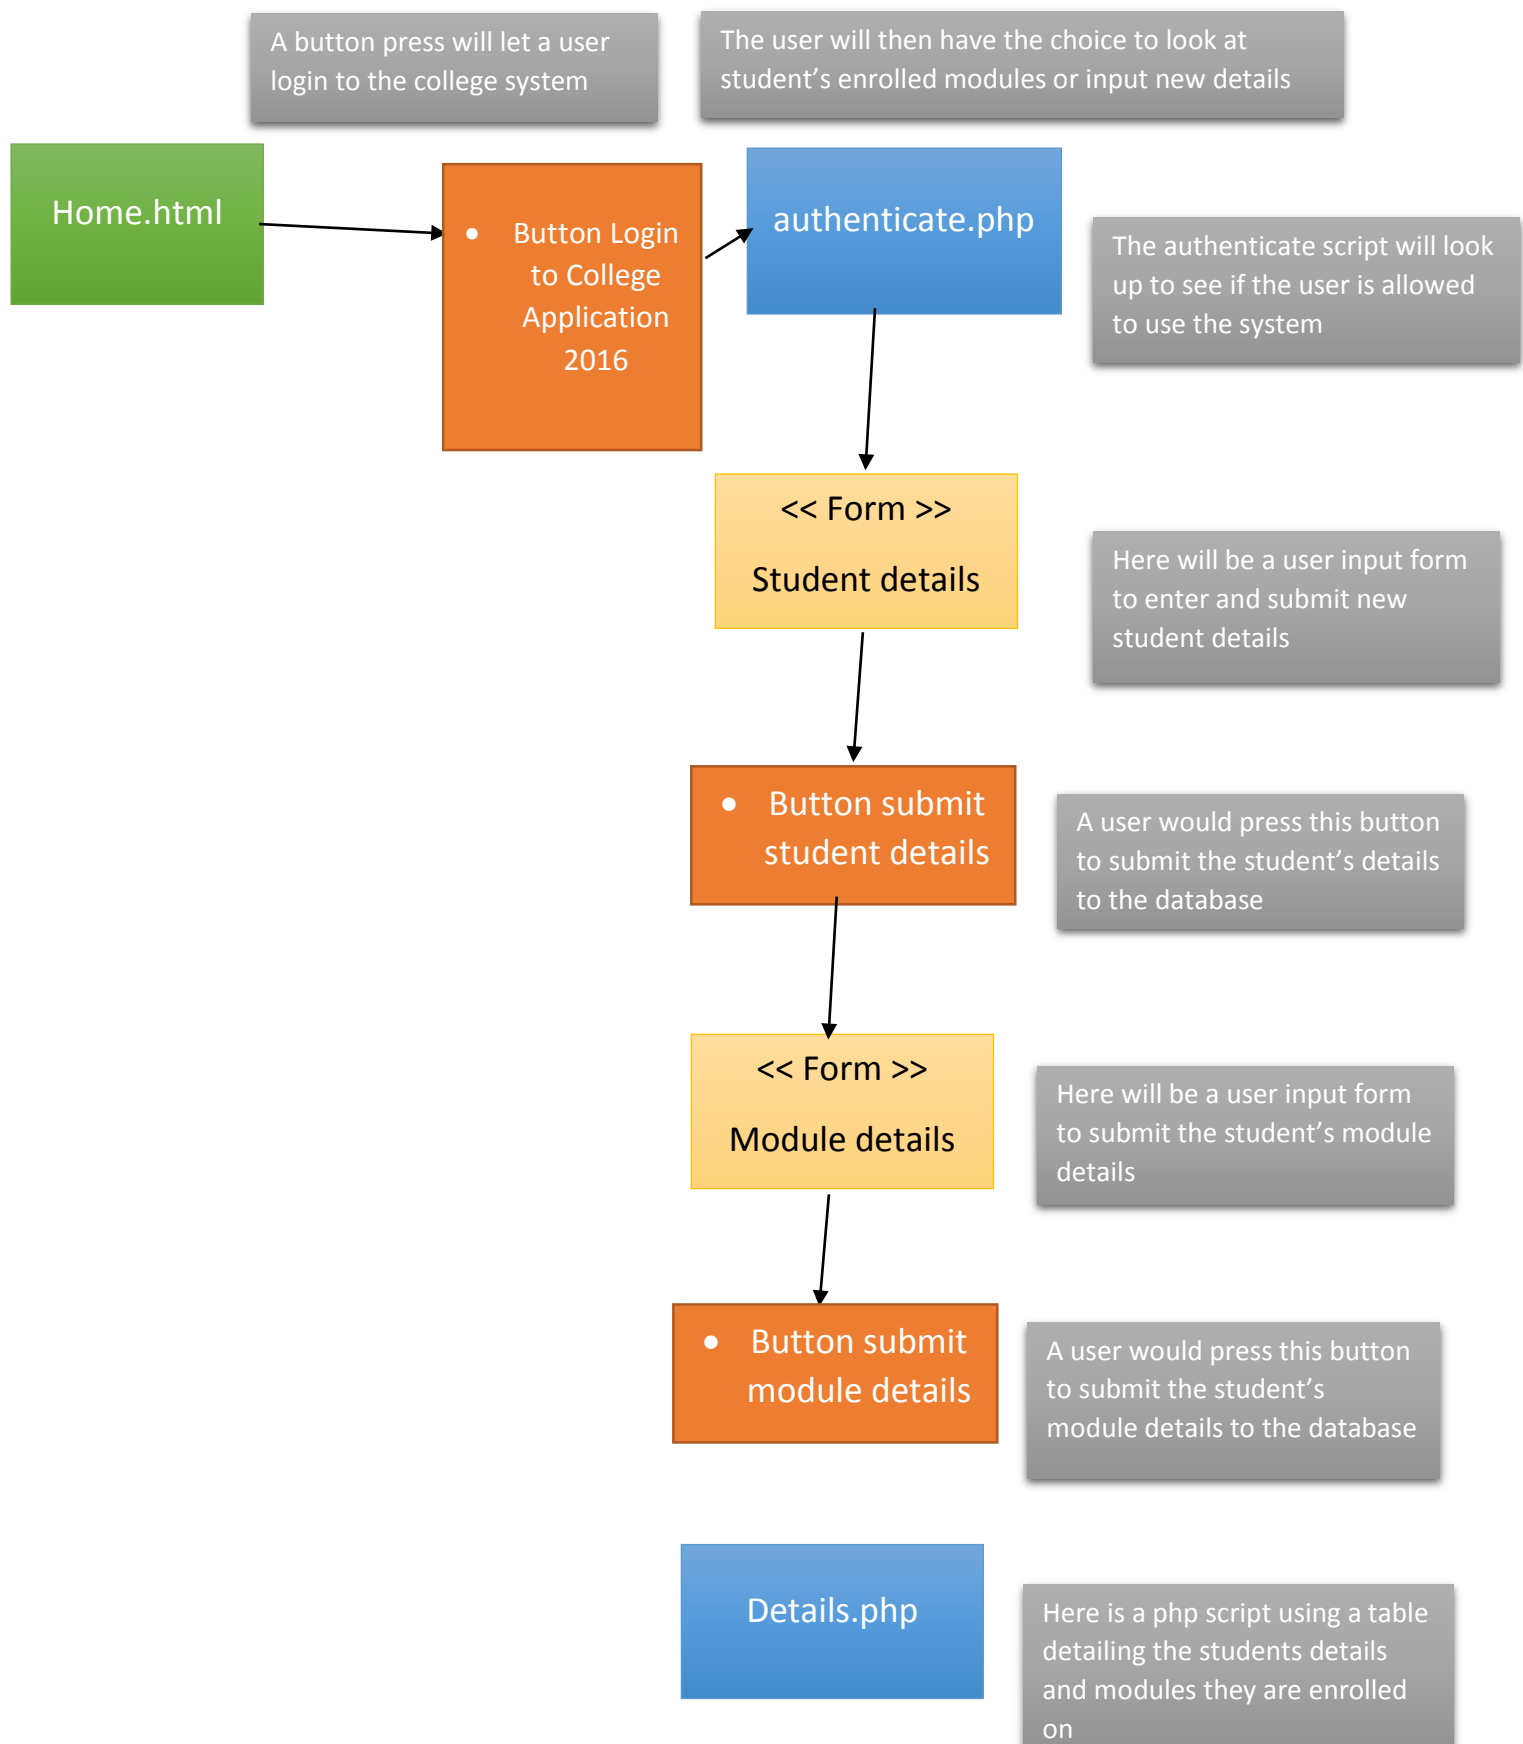

```
INSERT INTO 'db2_21302939'.'module' ('code', 'type', 'level') VALUES ('CO654', 'Practical', '6');
```

Here you can see the modules have been created using the php my admin tool what should happen now is when I login to the college application I should be able to now hopefully allocate the modules to a certain student

That has been created on the system

Task 2 – UML Diagram for the UN alternated college application

Colours Key reference for College Application 2016 UML Diagram – Task 2

Orange = Buttons

Golden Yellow = Forms

Green = client home.html page

Blue = Server Side php pages

Sliver = Explanations of each part of the UML diagram

Task 3 – Create a new script that will display all the student records within the student table.
The data within each field should be displayed inside the cells of an html table

The screenshot shows the phpMyAdmin interface for the database 'db2_21302939'. The 'student' table is selected. A successful SQL update is shown, followed by a query result for the 'student' table. The query is: `SELECT * FROM 'student' LIMIT 0, 30`. The result shows one row of data.

Student ID	Password	DOB	First Name	Last Name	house	Town	County	Country	postcode
20000000	1111	1991-11-10	Fred	Smith	23 Victoria Road	High Wycombe	Bucks	UK	HP11 1RT

You are logged in

[Your details](#)

[Modules page](#)

Task 4 -- Add a new column to the displayed student table that contains checkboxes that allow selecting each of the table rows for performing certain operations. Add a Delete Button in the bottom of the list that allows deleting the selected student records from the database.

Adding new students to the college application system

Let's see if the new students have been added to the student table again I used php my admin to check

I am going to select db2_21302939 to check

No they have not

So what I will have to do is add them manually using the php my admin in the real world this is a pain as developers have to get things correct but time was a factor here

file:///G:/BSC%...uthenticate.php x intweb.bucks.ac.uk / intwe... x +

in horizontal mode and repeat headers after 100 cells

+ Options

	Student ID	Password	DOB	First Name	Last Name	house	Town	County	Country	postcode
<input type="checkbox"/>	20000000	1111	1991-11-10	Fred	Smith	23 Victoria Road	High Wycombe	Bucks	UK	HP11 1RT
<input type="checkbox"/>	21245612	bucks1	1993-05-16	Sim	Child	145 Desborough Park Road	High Wycombe	Buckinghamshire	UK	HP13 4SA

Check All / Uncheck All With selected:

Show: 30 row(s) starting from record # 0

Evidence of showing new students added to the student table

One of the problems I got round in this project was to add students to the student table manually using the php my admin tool

The screenshot shows the phpMyAdmin interface for the database 'db2_21302939'. A SQL query has been executed successfully, updating one row. The query is:

```
UPDATE `db2_21302939`.`student` SET `house` = '23 Victoria Road' WHERE `student`.`Student ID` = '20000000' AND `student`.`Password` = '1111' AND `student`.`DOB` = '1991-11-10' AND `student`.`First Name` = 'Fred' AND `student`.`Last Name` = 'Smith' AND `student`.`Country` = 'UK' AND `student`.`postcode` = 'HP11 1RT' LIMIT 1 ;
```

The result shows '1 row(s) affected.' Below the query, the table structure is displayed with columns: Student ID, Password, DOB, First Name, Last Name, house, Town, County, Country, and postcode. The table contains one row of data:

Student ID	Password	DOB	First Name	Last Name	house	Town	County	Country	postcode
20000000	1111	1991-11-10	Fred	Smith	23 Victoria Road	High Wycombe	Bucks	UK	HP11 1RT

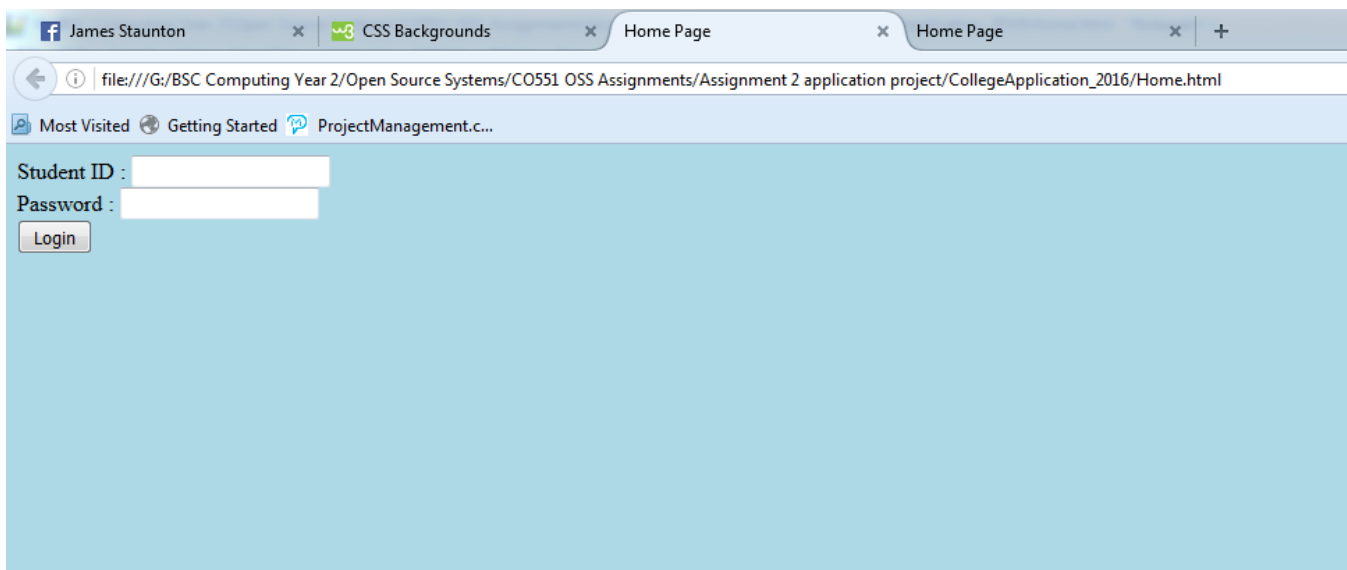

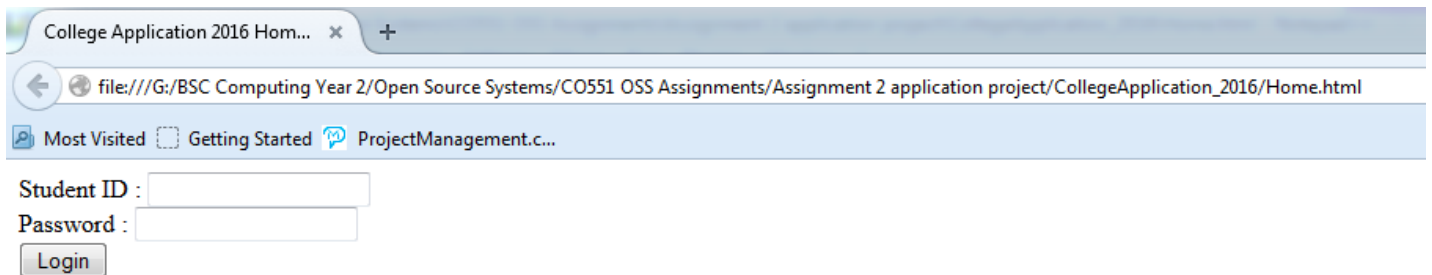

The screenshot shows the phpMyAdmin interface for the database 'db2_21302939'. The 'student' table is displayed with two rows of data. The table structure is shown with columns: Student ID, Password, DOB, First Name, Last Name, house, Town, County, Country, and postcode. The table contains two rows of data:

Student ID	Password	DOB	First Name	Last Name	house	Town	County	Country	postcode
20000000	1111	1991-11-10	Fred	Smith	23 Victoria Road	High Wycombe	Bucks	UK	HP11 1RT
21245612	bucks1	1993-05-16	Sim	Child	145 Desborough Park Road	High Wycombe	Buckinghamshire	UK	HP13 4SA

Task 6 -- Improving the UI/UX of the college application

There were a few things I wanted to change to make the system look more professional

Home Page background before and after

Source of: http://intweb.bucks.ac.uk/~21302939/UnAltered%20College%20App/Home.html - Mozilla Firefox

File Edit View Help

```
1 <html>
2 <head>
3 <title>Home Page</title>
4 <head>
5 <body>
6   <form name="frmLogin" action="authenticate.php" method="post">
7     Student ID :
8     <input name="txtid" type="text" />
9     <br/>
10    Password :
11    <input name="txtpwd" type="password" />
12    <br/>
13    <input type="submit" value="Login" name="btnlogin" />
14  </form>
15 </body>
16 </html>
```

Where is the CSS code for a home page background this needed to be added?

More logical title heading

Task 7 Evaluation of PHP and ASP.net

PHP

PHP stands for hypertext preprocessor.

PHP was originally designed as a scripting tool that has quickly taken over the internet. This is largely down to its easy learning curve

PHP has a large developer community with over 244 million websites using the tool.

PHP is also very good for cost as it is free which is good because it means users and developers don't have to buy it for a lot of money this will also save development costs on writing scripts.

PHP wins over asp.net for support as it is supported well by open source developer communists online such as W3 Schools. This is a good because

When it comes to cost however php is the one should go for as its cheap and secure and also php works with code in other core web languages which is HTML to make websites dynamic and also the web services all come in one package so on a windows system it would be **Windows Apache my sql and php**

ASP.net [Active Server Pages]

Here I will be evaluating ASP.net by doing this I will be looking at the advantages and disadvantages with using the language

The first advantage of ASP.net is it is very much multi usable in terms of flexibility and it has object orientated features with other programming languages such as VB.net and C# which means if you want to change the language of a written project you can and also multi developers can work on the same project to

All these are good benefits of ASP.net because it means developers could get projects finished sooner and they would be better quality

Another good benefit of using ASP is that its programming library is text based with it being organised into classes for precise tasks such as xml or image editing can save developers buckets of time which is good because it means projects might get finished on time or even ahead of time

ASP.net is bad however when it comes to cost as certain programs that run with the language such as Visual studio will cost a lot of money to keep upgrading to the latest versions e.g. 2013 Ultimate to 2015 Ultimate

Task 7 Evaluation of PHP and ASP.net continued

This section of task 7 I will talk about some of the key aspects when managing personal data on both the server side languages PHP and ASP.net

Key Security concerns - PHP

- Injection flaws
This is a big concern because php passes to sql databases you run risks in web query's by inserting malicious code fragments form parameters an attacker will aim or disable the web server completely
- Cross Site Scripting [XSS]
This will happen will hackers put in some JavaScript in a user form submitted content in an attempt to steal a user's data that can be deeply troublesome when on a user account or more a bad case on an admin account
- Encryption of data with Mcrypt
These work just fine in a readable form but however, it's not always an option it offers you the chance to store details such as credit card details in encrypted formats in order to use it you will need to decrypt it
This is being got round by something in the module named Mcrypt which is an add in for php that allows a developer to have high grade encryption
- Generating random passwords

People often guess passwords to try and hack and they get round this far too easily which means if someone forgot a password. However, if you are using MD5 hashes you will not be able to this is a concern as if you forget the password to a big system you will be locked out of it forever

Key Security concerns - ASP

- Authentication
This answers the question who the person is accessing these might be the end users other services processes or computers
- Auditing
This is a must and a concern which are server side developers have to bare in mind as you need to be able to set limits on things such as purchasing 15 copies of the same text
- Confidentiality
You as the developer must have respect for privacy as in sites like Amazon people's addresses and credit card details must be encrypted
- Availability

This is a vital security thing as a server side developer as you need to make sure the system remains available for everyday users. The biggest concern is when attackers come along with denial of service attackers to crash the application so other users cannot access the application

Managing Personal data – ASP.net

With ASP.net which is Microsoft's server side language some of the key security aspects of managing personal data to be in mind are as follows

Managing Personal data Principle	Concept overview
Secure the weakest link	Is there a vulnerability at the network layer that an attacker can exploit?
Reduce the attack surface	If you do not use it, remove it or disable it. Reduce the surface area of attack by disabling or removing unused services, protocols, and functionality. Does your server need all those services and ports?
Never trust the user's input	If your application's user input is the attacker's primary weapon when targeting your application. Assume all input is malicious until proven otherwise, and apply a defense in depth strategy to input validation, taking particular precautions to make sure that input is validated whenever a trust boundary in your application is crossed.

Managing Personal data – php

Managing Personal data Principle	Concept overview
SQL injection	This perhaps one of the biggest security concerns for managing personal data when using the php as your server side scripting language SQL injection is usually targeted at database driven websites such as web applications which link to databases, the attack happens exploit vulnerabilities in the site's security to send special sql queries
Cross Side Scripting	This is probably the most common form of security concern related php, It will happen when hackers use a legitimates site to force a website to do certain things
Directory Traversal	This happens when people hack in to the root directory and attackers are able to view restricted files and use the web server be executing commands. The attack starts though a web browser by a user entering a url into the web address bar
